

BACKGROUND OF INVENTION

1. FIELD OF INVENTION

The present invention relates to the field of watches with a dual function of:

- a. multiple alarm watch
- b. medication (pill) carrying/storing device

The timepiece is operated by an analog mechanism, which has either an audio or Silent (vibrating alarm.)

This present invention also relates to devices for providing medical information and **personal** identifying information combined with a timepiece/ pillbox.

When compared to prior art, this invention is unique by its simplistic mode of operation.

When compared to prior art, this invention offers the consumer several choices with just the purchase of one mediwatch, because it has multi-divisional interchangeable compartments which provides the wearer the choice of the insert that best suits his/her needs. Marketing it with this diversity is the most cost-effective method for the consumer.

The present invention also relates to the field of medical alert bracelets/necklaces and medical information cards. When compared to prior art, this invention has permanently engraved medical information on

the back of the base (pillbox) which no other prior art has.

This eliminates the need to wear a separate medical alerting device.
